

NowePack

EKO FOLIE

ECO films
enviromentally
friendly

Nowe Pack is the first manufacturer of ECO film with the proportion of natural mineral in the form of calcium carbonate CaCO_3 above 55%, which classifies the product into the group of biodegradable materials.

The **product development strategy** is to further increase the proportion of natural fillers in the produced ECO film, eliminating the negative impact of production on the environment. By implementing a number of technological innovations, we are able to offer our customers a product:

- highly ecological
- cost-effective
- tailored to customer needs
- responding to new trends and legal requirements for sustainable development principles.

Our product

Our ECO film is a homogeneous composite with a high amount of the natural mineral calcium carbonate CaCO_3 .

It is characterized by gas permeability, such as oxygen, which classifies it for packaging yeast. At the same time, it is impermeable to chemical compounds in the form of water, water vapor and fats, **which makes it ideal for packing a group of foodstuffs requiring special conditions**, such as in refrigeration when packing frozen foods. Due to these properties, it is also used for packing technical articles. ECO film is also **distinguished by its resistance to lactic-cheese acids** and does not contain talc, which qualifies it for packing of dairy products.

ECO film made with biodegradation technology can be recycled up to 7 times, is biodegradable in water for up to 5 years, and can be compostable. **We deliver the ordered product in a short time**, according to the predetermined parameters and visualization.

What you receive:

- Nowe Pack graphic studio support to create the visualization of the film print.
- Highest quality flexographic printing technology on dyed paper-like films.
- Short lead times, ability to buffer deliveries.
- Support in the implementation of the sustainable development policy.
